

However, sometimes I get distracted and do not realize that the sun has risen, and today, a fish almost caught me. Phew! This time it has been close. Luckily, I am very fast, and I was able to escape.

To learn more: Copepods are an important source of food for many marine fish and their larvae. To avoid predation by fish, copepods have pressure receptors on their antennae. When they detect a danger, they can escape very quickly, up to 3-6 km per hour. It seems little, but compared to their size, it is equivalent to a thousand times their body in a second!
